

BE - Geometry | TUESDAY 1-25-11

- ① WHAT IS THE DIFFERENCE BETWEEN ARC MEASURE AND ARC LENGTH?
- ② THE FOLLOWING CAR OWNERSHIP SURVEY WAS DONE - CONSTRUCT A CIRCLE TO REPRESENT.

<u>MAKE</u>	<u>NUMBER OF OWNERS</u>
Ford	13
GM	17
Toyota	20

- ③ What is the arc length of $\widehat{AB}$
- ⊙C radius = 12 cm AND $m\angle ACB = 20^\circ$

Homework Review Pg 532-3, #1-13 odd
#20, 32.

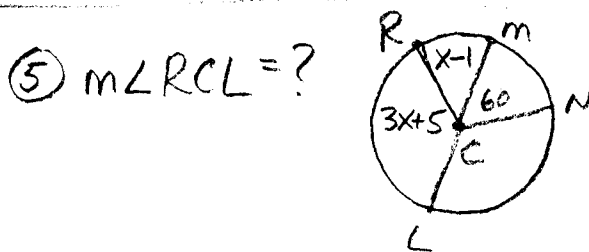

$\widehat{XY}$ or $\widehat{YX}$
 $\widehat{YZ}$ or $\widehat{ZY}$
 $\widehat{XZ}$ or $\widehat{XZY}$
 $\widehat{XYZ}$ or $\widehat{ZYX}$

$$m\widehat{XY} \sim 45^\circ$$

$$m\widehat{YZ} \sim 75^\circ$$

③ Concentric $\Rightarrow$ different ^(size) circles with same center point.

Congruent $\Rightarrow$ same size circles with different center point.

$$(3x+5) + (x-1) = 180^\circ$$

$$3x + x + 5 - 1 = 180$$

$$4x = 176$$

$$x = 44$$

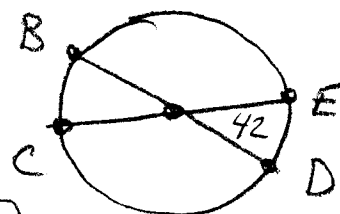

$$\therefore m\angle RCL = 3(44) + 5 = \boxed{137^\circ}$$

⑦ $m\angle RCN = ? \Rightarrow (x-1) + 60 = 43 + 60 = \boxed{103^\circ}$

⑨ $\odot A, m\angle EAD = 42^\circ$

$m\widehat{CBE} = ?$

$m\widehat{CBE} = \text{Semicircle} = \boxed{180^\circ}$

⑪ $m\widehat{CD} = ? \quad m\widehat{CD} \Rightarrow 180 - 42 = \boxed{138^\circ}$

⑬ Total $\Rightarrow 1400$ CFO's *(Nearest degree)
Find, measure of each $\angle$ in circle graph.

$2\% \Rightarrow \frac{2}{100} \cdot 360 \approx 7.2 = \boxed{7\%}$

$22\% \Rightarrow \frac{22}{100} \cdot 360 \approx 11(7.2) = 79.2 \approx \boxed{79\%}$

$25\% \Rightarrow \frac{1}{4} \cdot 360 \approx \boxed{90^\circ}$

$28\% \Rightarrow 25\% + 1\% + 1\% + 1\% \quad 1\% = 3.6$

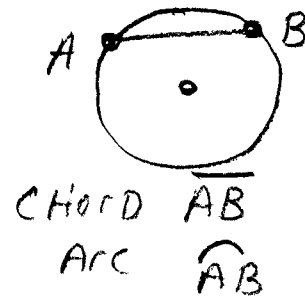

$\Rightarrow 90^\circ + (3.6)3 = 90^\circ + 10.8 = 100.8 = \boxed{101^\circ}$

$23\% \Rightarrow 22\% + 1\% = 79.2 + 3.6$

$= 82.8 = \boxed{83^\circ}$

10-3 Arcs And Chords

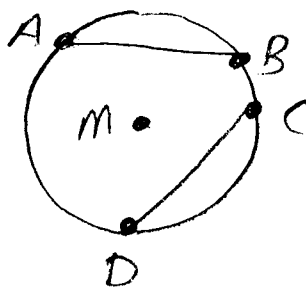

The endpoints of a chord are also endpoints of an arc

Theorem 10.2

In a $\odot$, 2 minor arcs $\cong$ iff the corresponding chords are $\cong$

(EX)

If $\overline{AB} \cong \overline{DC}$
then $\widehat{AB} \cong \widehat{DC}$

Also:

If $\widehat{AB} \cong \widehat{DC}$
Then $\overline{AB} \cong \overline{DC}$

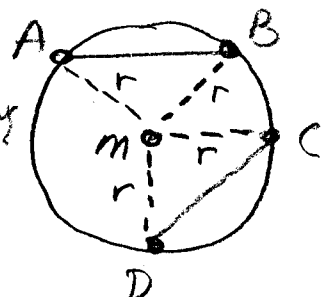

Proof: Given $\odot M$, $\widehat{AB} \cong \widehat{DC}$

Prove: $\overline{AB} \cong \overline{DC}$

Statement

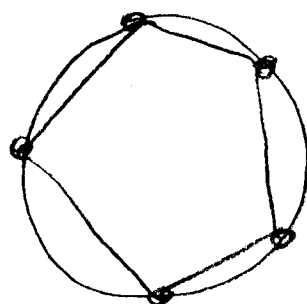

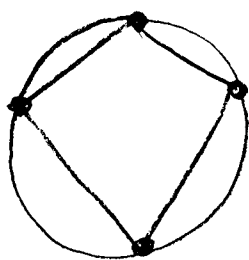

Reason

1. $\odot M$, $\widehat{AB} \cong \widehat{DC}$ Given
2. $\angle AMB \cong \angle DMC$ If arcs $\cong$, corresponding central $\angle$ s $\cong$
3. $AM \cong BM \cong DM \cong CM$ All radii $\cong$
4. $\triangle AMB \cong \triangle DMC$ SAS
5. $\overline{AB} \cong \overline{CD}$ CPCTC

The chords of adjacent can form a polygon. This is called an inscribed polygon because all the vertices are inside the circle.

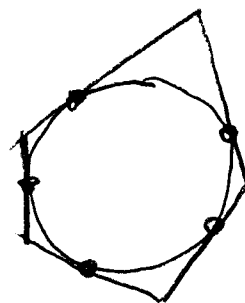

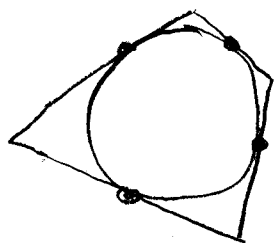

(EX)

The circles are circumscribed because they contain the vertices of the polygons.

If the circle is inscribed in a polygon, every side of the polygon that is circumscribed around the circle is tangent to the circle at every side.

(EX)

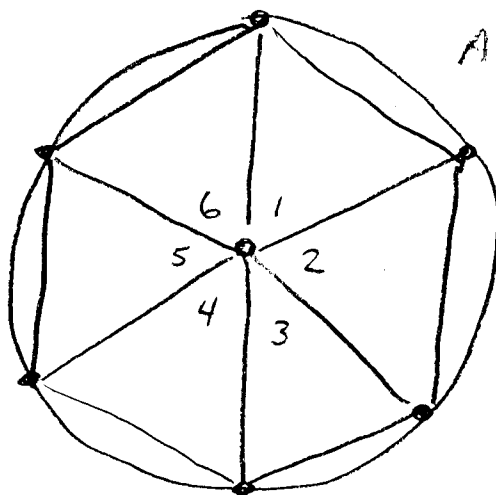

A regular polygon has all sides that are $\cong$. Therefore, in an inscribed polygon, all of the central $\angle$ s in a regular polygon are $\cong$

(EX)

see ex 2
pg 537

All sides $\cong$

All central $\angle$ s $\cong$

What is the measure of each central angle?

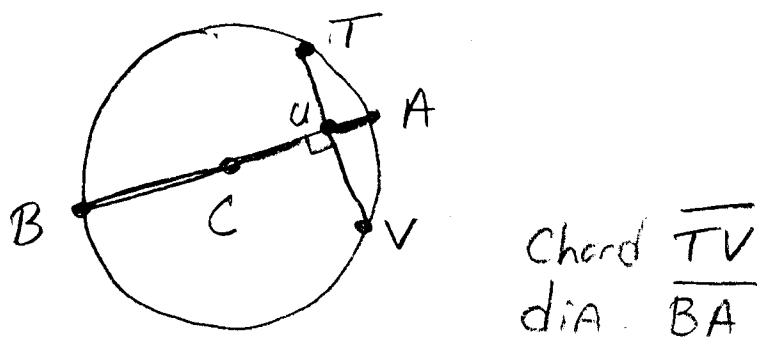

$$\frac{360}{6} = 60^\circ$$

NOTE: ALL 6 Δ 's are $\cong$ and are equilateral with each $\angle = 60^\circ$

Diameters and Chords — Perpendicular

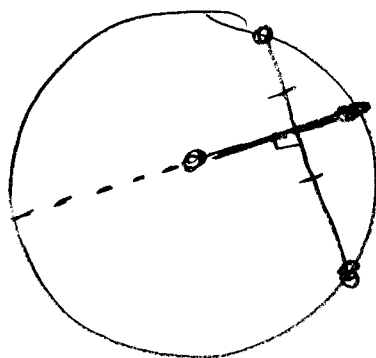

Diameters that are perpendicular to chords have the following properties:

Theorem 10.3 In a circle, if a diameter (or radius) is $\perp$ to chord, it bisects the chord and its arc.

$$\overline{TU} \cong \overline{VU}, \quad \widehat{TA} \cong \widehat{VA}$$

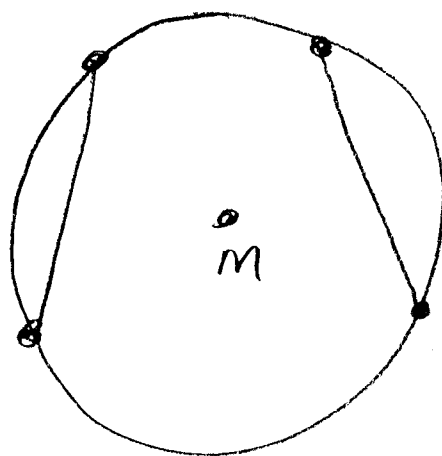

SAME IF RADIUS

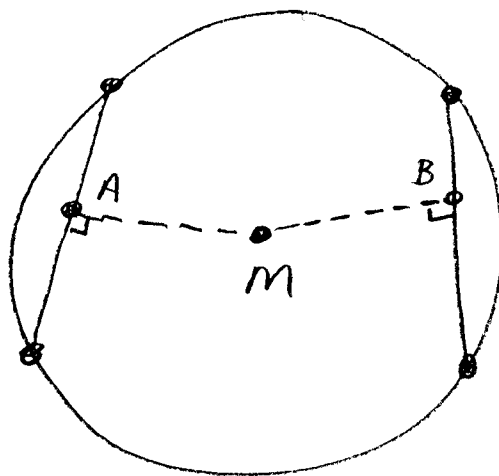

FINALLY:

Theorem 10.4 In a circle, 2 chords
are $\cong$ iff they are equidistant
from center

(EX)

How TO FIND
distance from
center?

Perpendicular
If $\overline{MA} \cong \overline{MB}$
then chords
and arcs $\cong$

HW: Pg 534 #47-50, 52.

Pg 540 # 11-17 odd, 23-25, 39.
