

BE - Geometry II Tuesday

4-24-12

① $f(x) = 5x + 10$

$f^{-1}(x) = ?$

② $g(x) = \frac{1}{5}x - 2$

$f[g(x)] = [f \circ g][x] = ?$

$f(x) = 5x + 10$

$f^{-1}(x) = \frac{1}{5}x - 2$

$g(x) = \frac{1}{5}x - 2$

$f[g(x)] = f\left(\frac{1}{5}x - 2\right) = 5\left(\frac{1}{5}x - 2\right) + 10$
 $= 1x - 10 + 10$

Look

$\boxed{= x}$

$g[f(x)] = g(5x + 10) = \frac{1}{5}(5x + 10) - 2$
 $= x + 2 - 2$

$\boxed{= x}$

* THE COMPOSITION OF INVERSE FUNCTIONS ALWAYS = X

1.
Use the composition of two functions, both ways, as a test to see if they are inverses.

From last night's homework:

$$\textcircled{1} \quad f(x) = 2x - 4 \quad f^{-1}(x) = \frac{1}{2}x + 2$$

$$f[f^{-1}(x)] \Rightarrow f(x) = 2x - 4$$

$$f\left(\frac{1}{2}x + 2\right) = 2\left(\frac{1}{2}x + 2\right) - 4$$

$$= x + 4 - 4$$

$$= x \quad \checkmark$$

$$f^{-1}[f(x)] \Rightarrow f^{-1}(x) = \frac{1}{2}x + 2$$

$$f^{-1}(2x - 4) = \frac{1}{2}(2x - 4) + 2$$

$$= x - 2 + 2$$

$$= x \quad \checkmark$$

$y = 2x - 4$ and $y = \frac{1}{2}x + 2$ are inverses

Homework Review

Finding the Inverse of A Function

(1)

In[6]:= $f[x_] := 2x - 4$

In[7]:= `InverseFunction[f][x]`

Out[7]= $\frac{4 + x}{2}$

In[8]:= `Graph y=2x-4, y=(4+x)/2, y=x`

↳ Plot

`Plot[{-4 + 2 * x, (4 + x) / 2, x}, {x, -6.7, 6}]`

(2)

```
In[9]:= f[x_] := (1/2) x + 3
```

```
In[10]:= InverseFunction[f][x]
```

```
Out[10]= 2 (-3 + x)
```

```
In[11]:=  Graph  $y=(1/2) x + 3$ ,  $y=2(-3+x)$ ,  $y=x$ 
```

```
↳ Plot
```

```
Plot[{3 + x / 2, 2 * (-3 + x), x}, {x, -10, 9}]
```

(3)

```
In[12]:= f[x_] := 4 x - 1
```

```
In[13]:= InverseFunction[f][x]
```

```
Out[13]=  $\frac{1+x}{4}$ 
```

```
In[14]:=  Graph y=4x-1, y=(1+x)/4, y=x
```

```
↳ Plot
```

```
Plot[{-1 + 4 * x, (1 + x) / 4, x}, {x, -1.5, 1}]
```

(4)

```
In[15]:= f[x_] :=  $\left(\frac{-3}{4}\right)x + 6$ 
```

```
In[18]:= InverseFunction[f][x]
```

```
Out[18]:=  $-\frac{4}{3}(-6 + x)$ 
```

```
In[19]:= Expand $\left[-\frac{4}{3}(-6 + x)\right]$ 
```

```
Out[19]:=  $8 - \frac{4x}{3}$ 
```

```
In[20]:=  Graph  $y = (-3/4)x + 6$ ,  $y = 8 - (4x)/3$ ,  $y = x$ 
```

```
↳ Plot
```

```
Plot[{ $6 - (3 * x) / 4$ ,  $8 - (4 * x) / 3$ ,  $x$ }, {x, -3.3, 13}]
```

```
Out[20]=
```

ONE TO ONE
function

A function that has an
inverse that is also
a function.

Easy test:

- ① PASS VERTICAL LINE TEST
⇒ FUNCTION (VLT)
- ② PASS horizontal line test
⇒ inverse is a function
(HLT)

EX

Passes VLT ⇒ Function ✓
 Passes HLT ⇒ Inverse
 is a
 Function ✓

EX

Passes VLT
 ⇒ Function ✓
 FAILS HLT
 ⇒ inverse is
 NOT A
 Function

Determine whether the pair of functions are inverses

$$f(x) = 6x + 2 \quad g(x) = x - \frac{1}{3}$$

$$\begin{aligned} f[g(x)] &\Rightarrow f\left(x - \frac{1}{3}\right) = 6\left(x - \frac{1}{3}\right) + 2 \\ &= 6x - 2 + 2 \\ &= 6x \quad \underline{\text{No}} \end{aligned}$$

Could stop there, it doesn't matter if $g[f(x)] = x$ or not.

Could check by finding $f^{-1}(x)$

$$y = f(x) = 6x + 2$$

↘ SWAP ↙

$$x = 6y + 2$$

$$x - 2 = 6y$$

$$\frac{x-2}{6} = y \quad \neq x - \frac{1}{3} \quad \checkmark \text{ NOT INVERSES}$$

CONVERTING FROM °F TO °C

$$y = f(x) = \frac{5}{9}(x - 32)$$

x = deg Fahrenheit
y = deg. Celsius

OF WHAT use would be the inverse function?

$$f^{-1}(x) \Rightarrow x = \frac{5}{9}(y - 32)$$

$$\frac{9}{5}x = y - 32$$

$$\frac{9}{5}x + 32 = y$$

$$\therefore y = f^{-1}(x) = \frac{9}{5}x + 32$$

x = deg. Celsius
y = °F

CK: $x = 0^\circ$

$y = 32 \checkmark$

$x = 100$

$y = 180 + 32 = 212 \checkmark$

Homework:

Use Algebra, determine whether each pair of functions are inverses

$$\textcircled{1} f(x) = x + 7$$

$$g(x) = x - 7$$

$$\textcircled{2} g(x) = 3x - 2$$

$$f(x) = \frac{x - 2}{3}$$

$$\textcircled{3} f(x) = 3x + 4$$

$$g(x) = 3x - 4$$

$$\textcircled{4} g(x) = 2x + 8$$

$$f(x) = \frac{1}{2}x - 4$$

Find the inverse of each function then graph the function, the inverse, and a dashed $y = x$ line of symmetry

$$\textcircled{5} f(x) = x - 5$$

$$\textcircled{6} f(x) = \frac{4}{5}x - 7$$
